

FOR IMMEDIATE RELEASE:

Critical Messaging Company Expands its Business During Difficult Economic Times

ALPHARETTA, Georgia, U.S.A. (May 27, 2013) – Prism-IPX Systems LLC, an industry leading critical messaging system manufacturer based in Alpharetta, Ga., U.S.A., announced it has acquired the assets of Onix Electronic Systems, Inc. of Summerville, S.C. which does business as Hark Technologies.

The transaction includes technology and products that Prism-IPX and Hark Technology will cross-integrate into both product lines, extending the combined companies' lead with innovative products for paging and other critical messaging technologies. The two companies lead the industry with integrated and external secure message encryption solutions.

"Our acquisition of the Hark Technologies business further enhances Prism-IPX's product and support services portfolio and increases our ability to bring new and innovative products to our customers," said Jim Nelson, President and CEO of Prism-IPX Systems. "With our focus on critical messaging our combined products provide secure, encrypted messaging from text input all the way to message display on compatible devices. This is vital to the healthcare, public safety and utility producers to protect access to and confidentiality of their internal communications."

David George and William (Bill) Noyes, previous owners of the Onix company, have joined Prism-IPX Systems as Senior Development Engineers and will work on new product development and existing product enhancements as well as help with product support.

"This is an ideal fit for our company and provides the development resources, distribution and support we needed for the products we have developed. We look forward to joining the Prism-IPX team and," said David George, Onix President.

"I am delighted to have David and Bill join the company and bring with them the products and technologies they have developed over the years," said John Bishop, Prism-IPX Systems COO. "Their combination of knowledge and experience will immediately help our company offer more of the products and services our customers need."

Prism-IPX designs powerful and robust software and hardware systems using modern network technologies (IP, SIP, VoIP) along with secure network technology to manage connections to control local and remote broadcast sites and deliver highly reliable text messaging to people and devices. The company's products are used extensively for private and commercial systems in healthcare, public safety, energy production and many other markets where mission critical messaging is required.

With the combined resources of its Australian owned partner, Xacom International, Prism-IPX has increased its staff in its Alpharetta, Ga. office to handle its growth in providing critical messaging systems. Increased demand for Prism-IPX products and services in the U.S. and International markets is fueling growth. Recent additions to administrative staff along with software development, sales and technical support, increased the need to expand its office

space. More company growth is expected and future plans are to bring more jobs in both locations with the addition of staff positions. Current staff for Australia, US and UK combined is over 40 employees plus indirect sales channels, contact engineering and support providers.

Critical messaging, especially systems utilizing paging technology, works when other technology does not. During disasters and/or terrorist attacks, paging systems have proven to be effective and reliable and can reach millions of users simultaneously. The dependable performance is based on the way messages are received and equipment functions. Paging systems, unlike cellular systems, operate from a dedicated radio channel and do not compete with other devices for signals, thereby providing high availability and redundancy. Additionally, paging towers have a broad reach and can be located a further distance from the heart of a disaster and still provide critical paging where needed. In emergency situations, backup towers can be erected quickly and easily, if necessary, with no major interruption of service or critical message delivery.

About Prism-IPX Systems LLC:

Prism-IPX Systems LLC is a partnership between U.S. companies Prism Systems International, Inc. and Xacom International, LLC which is wholly owned by Australian company Xacom Pty Ltd, a leading developer and supplier of healthcare and commercial messaging and monitoring systems. By combining products and development resources the companies now provide critical messaging solutions around the world for country-wide, regional and local commercial and private paging system operators, healthcare, public safety, energy producers and government facilities.

About Onix Electronic Systems, Inc. / d.b.a. Hark Technologies:

Hark Technologies designs communication software and servers for the personal messaging industry. This includes paging carriers and cellular phone companies. The company's Omega communication servers have been in use since 1996 including one of the first voice mail systems to add Internet messaging features. In recent years Hark Technologies has concentrated, with great success, on developing appliance based messaging products to complement its software messaging platforms.
